How Motorcycle Engine Works

How the 2-Stroke Engine Works. In the 2-stroke motorcycle engine, fuel and air are introduced through the intake port. The piston pumps up and down and compresses the fuel and air, and then the spark plug ignites. This leads to combustion, which gives energy to the pistons to pump and turn the crank, shoving exhaust out of the exhaust port.

An inline three-cylinder engine with 180° crankshaft can be found in early examples of the Laverda Jota motorcycle made by Italian manufacturer Laverda. In these engines, the outer pistons rise and fall together like a 360° straight-two engine. The inner cylinder is offset 180° from the outer cylinders.

The piston moves back up the cylinder because of the momentum produced during the power stroke and the weight of the flywheel (in a single cylinder motor), or due to the firing of other cylinders. The exhaust valve opens, and instead of compressing the burned gases, they are pushed out into the exhaust port.
